

1a:

1b:

2a.) $\beta = \frac{2\pi}{N}$, $N = \{25, 50, 100, 200, 400\}$, $\lambda = 2\pi$

N	β
25	.251
50	.126
100	.063
200	.031
400	.016

As expected, β decreases as N increases.

2c.) $\lambda = 2\pi$, $c=1$, $h=.1$, $\sigma=.5$

$$1 - \sigma + \sigma \cos B$$

$$1 - .5 + .5 \cos 1 = .9975$$

For: $|g| = \sqrt{(1 - \sigma + \sigma \cos B)^2 + (\sigma \sin B)^2}$

$$= \sqrt{(.9975)^2 + \sigma^2 \sin^2 B}$$

$$= \sqrt{.995 + .00249}$$

$$\sigma^2 \sin^2 B = .00249$$

$$|g| = .99875^N \rightarrow N = \frac{\ln .5}{\ln .99875} = \boxed{555}$$

$.99875^N = .5$

First order upwind requires 555 steps before the amplitude is $\frac{1}{2}$ of the exact solution.

L-W: $|G| = 1 - \sigma^2 + \sigma^2 \cos B + i\sigma \sin B$

$$|g| = \sqrt{(1 - \sigma^2 + \sigma^2 \cos B)^2 + (\sigma \sin B)^2}$$

$$|g| = .999997$$

$$.999997^N = .5 \rightarrow \frac{\ln .5}{\ln .999997} \Rightarrow \boxed{N = 296,247}$$

Lax-Wendroff requires 296247 steps before the amplitude is $\frac{1}{2}$ of the exact solution.

2d.) Fou: $|g| = \sqrt{(1 - \sigma + \sigma \cos B)^2 + (\sigma \sin B)^2}$

LW: $|g| = \sqrt{(1 - \sigma^2 + \sigma^2 \cos B)^2 + (\sigma \sin B)^2}$

$$.9999972602 = \sqrt{(1 - .5 + .5 \cosh)^2 + (.5 \sinh)^2}$$

$$|g| = .9999972602 \dots$$

$$.9999945204 = (.5 + .5 \cos(h))^2 + (.5 \sin(h))^2$$

$$h = .0043$$

$$\swarrow \frac{2\pi}{h}$$

This h will require 1462 points in each dimension.

In 3D, our number of points becomes N^3 . Lax-Wendroff becomes advantageous as you add dimensions because the number of required points is significantly lower.
